cs.activitystream

Module `cs.activitystream.__init__`

`cs.activitystream.create_system_posting(cdb_object, msg_label, check_rules=True)`

Creates a system posting. `cdb_object` can either be an instance of `cdb.objects.Object` or a `cdb.platform.mom.CDBObjectHandle`. `msg_label` defines the message label to use. `check_rules` is optional and set to `True` by default. If it is set to `True` all related rules will be checked before the posting job is created. Otherwise the job will be created directly without further checks.

class `cs.activitystream.PostingRuleChecker`

checkRules (*oh*)

Checks whether *oh* matches all rules that are specified for a system posting of the objects class within the data dictionary.
